PROFESSIONAL SUMMARY

Backend developer with 3+ years of experience designing scalable API services and AI-powered backend systems using Python and FastAPI. Specialized in building asynchronous backend architectures, background processing pipelines, and data-driven platforms that integrate machine learning services, large media workflows, and distributed systems. Experienced in designing RESTful APIs, managing relational databases (PostgreSQL), implementing task queues (Celery), and building backend services that support high-volume data processing and AI validation pipelines. Passionate about building scalable infrastructure that connects AI systems, databases, and external services into reliable production platforms.

SKILLS

- | | |
|---|--|
| • Python, Javascript, Object-oriented programming | • FastAPI, Django, REST API Design |
| • Distributed Systems | • Asynchronous Programming |
| • Celery, Background Job Processing | • SQL, PostgreSQL, MySQL, MongoDB |
| • Docker, AWS EC2, Linux | • Prometheus, Grafana |
| • Data & AI Integration, LLM API Integration | • Data Processing Pipelines, NLP Systems |
| • Web Scraping, WebSockets | • Git proficiency |
| • Agile methodologies | • Team collaboration |
| • Project documentation | • Software development lifecycle |

WORK HISTORY

Software Engineer (AI & Backend Systems), 09/2025 - 03/2026

Developers Foundry Fellowship – Abuja, FCT

- Developed backend infrastructure for the AIMAS (AI-based Incident Management & Alert System), an event-driven microservice platform that analyzes system metrics and generates automated operational recommendations for developers.

Key Contributions:

- Built an event-driven recommendation microservice using FastAPI and RabbitMQ that consumes system metrics and log events to generate automated recommendations, enabling real-time analysis of system metrics across multiple monitored hosts.
- Designed a hybrid analysis engine combining deterministic rules and optional LLM processing, enabling automated incident recommendations and reducing manual troubleshooting effort for infrastructure anomalies.
- Implemented asynchronous message consumers and publishers using RabbitMQ topic exchanges, enabling scalable communication between monitoring services and downstream systems.
- Developed REST APIs and persistence layers (SQLite) to store and query recommendations with filtering and pagination, while exposing health and readiness endpoints to improve service observability and operational reliability.

Backend & AI Systems Developer, 06/2023 - 02/2024

M365connect – Latvia, Latvia

- Developed backend systems powering AI-driven recruitment automation and large-scale job data ingestion pipelines.

Key Contributions:

- Built backend services for automated job data ingestion, processing thousands of job listings from multiple sources daily using scraping workflows and structured data pipelines.
- Designed an AI-assisted compatibility scoring system that matched candidates to job opportunities, reducing manual recruitment screening time by over 70%.
- Implemented rate-limited scraping and IP rotation mechanisms to ensure reliable data collection while avoiding platform detection and service disruption.
- Maintained production backend APIs and ensured code quality through structured documentation and testing.

Software Developer Intern, 01/2023 - 05/2023

ExploreAI – Gauteng, South Africa

- Contributed to backend development and infrastructure improvements for data-driven applications.

Key Contributions:

- Assisted in developing REST APIs using Django and Python.
- Designed and optimized relational database models and SQL queries.
- Supported CI/CD workflows and Docker-based deployments.
- Investigated and resolved backend production issues to improve system stability.

PROJECTS

EdTech Autograder Platform

Personal Project | Backend Infrastructure

Designed and built a scalable backend platform for automated programming assignment evaluation and AI-assisted grading, supporting asynchronous execution pipelines and secure code validation.

- Built FastAPI backend APIs to handle assignment submissions, grading requests, and result retrieval for a multi-user educational platform.
- Implemented asynchronous grading pipelines using Celery and Redis, enabling background processing of code execution, test validation, and automated result generation.
- Developed a secure Docker-based sandbox execution system to safely run untrusted student code with resource isolation and time limits.

Freelancer Job Alert SaaS

Developed a real-time backend notification system for freelancers on Upwork for job opportunities.

Key Features:

- Real-time backend communication using WebSockets
- Automated job matching notifications
- Backend event-driven architecture
- Designed PostgreSQL database models for assignments, submissions, grading results, and instructor feedback, optimizing queries for scalable evaluation workflows.

EDUCATION

Bachelor's Degree: Computer Science, 01/2026

University of The People - Pasadena, California

Diploma: Software Engineering, 01/2025

ALX - Africa

Advanced Diploma: AI & Data Science, 06/2023

ExploreAI Data Science Academy - Guateng, South Africa
